

PART A

STUDENT NAME: SARKODIE SHANELL

STUDENT ID: 22371334

TEAM NAME: JASKON – TECH

PROJECT TITLE: ACHIVERSE – A CENTRALISED PROJECT TRACKING AND CLIENT ENGAGING SYSTEM FOR
ASAMOAH WELBECK & ASSOCIATES

CLIENT: ASAMOAH WELBECK & ASSOCIATES

DATE: 13TH JULY, 2026

USE CASE NAME: USER LOGS OUT SECURELY (USER AUTHENTICATION AND ACCOUNTS MANAGEMENT

SOURCE EVIDENCE: AN EMPLOYEE AT CLIENTS FIRM.

PART B

1. **Actor:** Registered User
2. **Goal:** To securely end the user's current session and protect the user's account from unauthorized access.
3. **Trigger:** The user clicks logout.
4. **Preconditions:** The user is logged into Asamoah Welbeck & Associated domain.
The user has an active session.
5. **Main Success Flow:**
 1. The user clicks the logout button.
 2. The system receives the logout request.
 3. The system terminates the user's active session.
 4. The system redirects the user back to the login page.
 5. The system displays a message confirming that the user has successfully logged out.
6. **Alternate Flow:**

A1 Logout confirmation is required.

 1. The user clicks the logout button.
 2. The system displays a confirmation message asking whether the user wants to logout.
 3. The user selects Yes.

7. Exceptional Flow:

Session has already expired

1. The user clicks the logout button.
2. The system detects the session is no longer active.
3. The system directs the user to the login page.
4. The system displays the message "session expired. Please log in again".

8. Post conditions:

1. The user's session has been terminated.
2. Authentication information has been removed.
3. The user is no longer able to access the protected pages without logging in again.
4. The user is returned to the login page.

USER STORY: As a logged-in user I want to logout of my account so that my account remains secure when I finish using the system.

Acceptance criteria:

- Successful path

Assuming the user is logged into the system, when the user clicks the Logout button, the system shall terminate the user's session, invalidate all active session credentials, and redirect the user to the login page.

- Error/Exceptional path

GIVEN the user has already been logged out or their session has expired, when the user attempts to access a protected page or submits another request, then the system shall deny access, redirect the user to the login page, and display a message indicating that the session has expired or that the user must log in again.

9. Non-functional Requirement(NFR)

Category: Security

The system shall securely terminate the user's session, invalidate all active session credentials, and prevent access to protected resources immediately after the user logs out.

Why it matters: The system stores sensitive client information, project documents, and department-specific data. Secure session termination helps prevent unauthorized users from accessing confidential information if a device is left unattended or shared.

GitHub issue link

Issue title: User logout

Issue URL: <https://github.com/Dept-of-Comp-Sci-University-of-Ghana/dcit208-client-project-2026-team-engineering-repository-seg26-44-jaskon-tech/issues/8>

10. Traceability Row

Requirement/source	Use case	User story	NFR	Acceptance criteria	Test idea	status
Client interview – users must be able to end their session securely to protect sensitive and project information.	User logs out securely	As an architect at Asamoah Welbeck & Associates architectural firm, I want to securely log out of the system so that unauthorized users cannot access my account or confidential client and project information after I'm done using the system.	The system shall securely terminate the user's session, invalidate all active session credentials and redirect the user to the login page	Assuming the user is logged into the system, when the user clicks the 'logout' button, the system shall terminate the user's session and redirect the user to the login page.	Log in as a registered user, click logout, then try to access the dashboard by entering the dashboard URL. Verify that the system redirects the user to the login page and denies access.	Proposed

Test idea:

Test name: Verify Secure User Logout.

Log in as a registered user, click logout, then try to access the dashboard by entering the dashboard URL. Verify that the system redirects the user to the login page and denies access.

11. Request Flow Thinking

- Device: desktop computer or laptop. Interface: web application.'
- Screen: The action is performed through a web browser.
- Data sent: The screen where the logout button is located.
- Validation point: User session ID.
- Database: The logout request is coming from an authenticated user.
- User_Sessions
- The user is redirected to the Login Screen.
- A message is displayed, "Your session has expired. Please login again".
- Failure point: The system informs the user that the logout request could not be completed at that moment.

- Security/privacy concern: Client personal information, project document and architectural designs.

AI Disclosure: I used AI. I used Claude AI and chatGPT to help me construct some of my sentences and also format the work and also help with the Non-Functional Requirement. This work was review and verified before submission. I understand the use case, story, acceptance criteria and traceability links submitted here, and I can explain them orally if called upon.
